

The first project cost management solution that enables vertical cost visibility of an entire project from field to back-office.

---

Coreworx Oncore provides real time cost information, contract validation, and approvals for operations management and capital projects. We focus on the superior management of the labor, equipment, materials, and expense data and metrics for business operations and capital projects. Our customers are E&C and operating companies that perform projects in the normal course of their business. We work closely with them to deliver industry leading systems for effective capture and measurement of real-time cost data to optimize project performance.

Oncore's heritage stems from core values and best practices of project and cost management experts, and its proven power to handle the most complex cost structures with ease distinguishes itself from the field.

Coreworx delivers Oncore as a world-class hosted service geared toward rapid time to value, avoiding the cost of server hardware and reducing support and implementation requirements.

## Real-Time Data Capture

Oncore's highly flexible and configurable real-time data capture system provides a single point of entry for multiple stakeholders to input all cost and progress measures. Costs are collected as near as possible to their source providing clarity and granularity in information.

Oncore supports input and acquisition of Labor hours, Equipment hours, Materials usage and Expense charges.

## Real-Time Tracking

Our clients can see problems as they begin to occur, take action, and see the impact of their actions in real time. Real time monitoring of contracts provides the ability to improve workforce performance during the work rather trying to impact the job after it's finished.

## File Attachment

The industry's best approvals functionality provides flexible features for managing approval of large volumes of transactions. Personalized views for approvers can incorporate filters, sorting and summarization techniques to get the job done accurately and efficiently.

## Budget and Forecasting

Oncore's Budget and Forecasting module allows our customers to plan and monitor a project from end-to-end. Building on Oncore's configurable Work Breakdown Structure, budgets can be built within Oncore on a time-phase basis allowing our customers to plan how much they will spend on each item and when they will spend it.

## Cost Validation

Oncore instantly calculates and validates cost inputs according to business or contractual rules and terms that are recorded in the system. Double billings, rate overcharges and manual time and cost reconciliations are eliminated.

- Automatically recalculate and apply new rates as a result of rate changes made on the basis of contract agreements or other reasons during or after completion of a work item, activity or project.

- Uses an intuitive Excel style data entry and maintenance display for rate management.

- Easily add new effective dates and rates to existing rate tables, which will automatically take effect on the specified dates.

- Apply one or more rate tables to Work Packages at any level of the Project WBS.

- Maintain a complete audit trail of all additions and revisions to project rates.

## Real-Time Queries

Real-Time Queries provides Oncore users with a fast way to view costs and hours in Oncore without spending precious time developing complex reports and filters. By tying in Oncore's robust security model to the queries, all users across the organization can use Real-Time Queries to safely see the information they need while being secured out from the information they are not permitted to view. Users can quickly determine what costs have been invoiced, paid and exported to the other systems for consistent reporting across the organization.

## Exelerator

The Exelerator Module helps you use spreadsheet templates as part of the Oncore environment for data capture. Exelerator eliminates many of the problems experienced when using spreadsheets for managing data, such as:

- Eliminate managing & archiving multiple spreadsheets

- Data Integrity Pre-populating of Information

- Change Management & Version Control

- Auditing & Data Security

- Simplified data import and export
